

Name : Panchal Heer

Subject : Introduction to Web Design

Session 1 : Introduction to Web Design

Introduction :

Web design is the process of creating and maintaining websites using technologies such as HTML and CSS.

- Web browsers read HTML and CSS code and render web pages that users can interact with.
- Understanding the DOM(Document Object Model) ,front-end development , and browser developer tools is essential for modern web development.

How Browsers Render HTML and CSS ?

- 1.Browser reads the HTML file.
- 2.Browser creates the DOM structure.
- 3.Browser reads CSS styles.
- 4.HTML and CSS are combined.
- 5.The final webpage is displayed.

Front-End vs Back-End

Front-End	Back-End
------------------	-----------------

Visible to users	Works behind the scenes
Uses HTML , CSS , Javascript	Uses databases and server-side code
Handles UI design	Handles business logic

Chrome DevTools :

Chrome DevTools helps developers inspect HTML elements , edit CSS , debug issues , and analyze webpage structure.

Task 1 : Inspect Element

Objective

Inspect on Instagram post image using Chrome DevTools.

Observation

HTML tag :

`<img>`

CSS Class

Instagram uses dynamic classes that may change frequently.

- The image is displayed using the `<img>` tag and styled using dynamically generated CSS classes.

Task : 3 Use chrome DevTools to change the background color of your name.

1. Opened myprofile.html file in Google Chrome browser.
2. Right-clicked on the name “Panchal Heer” (<h1> element) and clicked on **Inspect**.
3. Chrome DevTools opened on the right side of the browser.
4. Selected the <h1> element in the Elements panel.
5. In the Styles section, added the following CSS **property:background-color: yellow;**
6. The background color of my name changed instantly in the browser without modifying the HTML file.

Task 4 : DOM Structure of myprofile.html Page

html

```
└─ head
|   └─ meta charset
|   └─ meta viewport
|   └─ title (My Profile)
|   └─ img (Profile Picture)
|   └─ style
|
└─ body
    └─ h1 (Panchal Heer)
```

└─ p (Bio content)

- DOM structure shows parent-child relationship of HTML elements.
- HTML is root, head and body are its children, and other tags are nested inside them.
